

ILI incidence

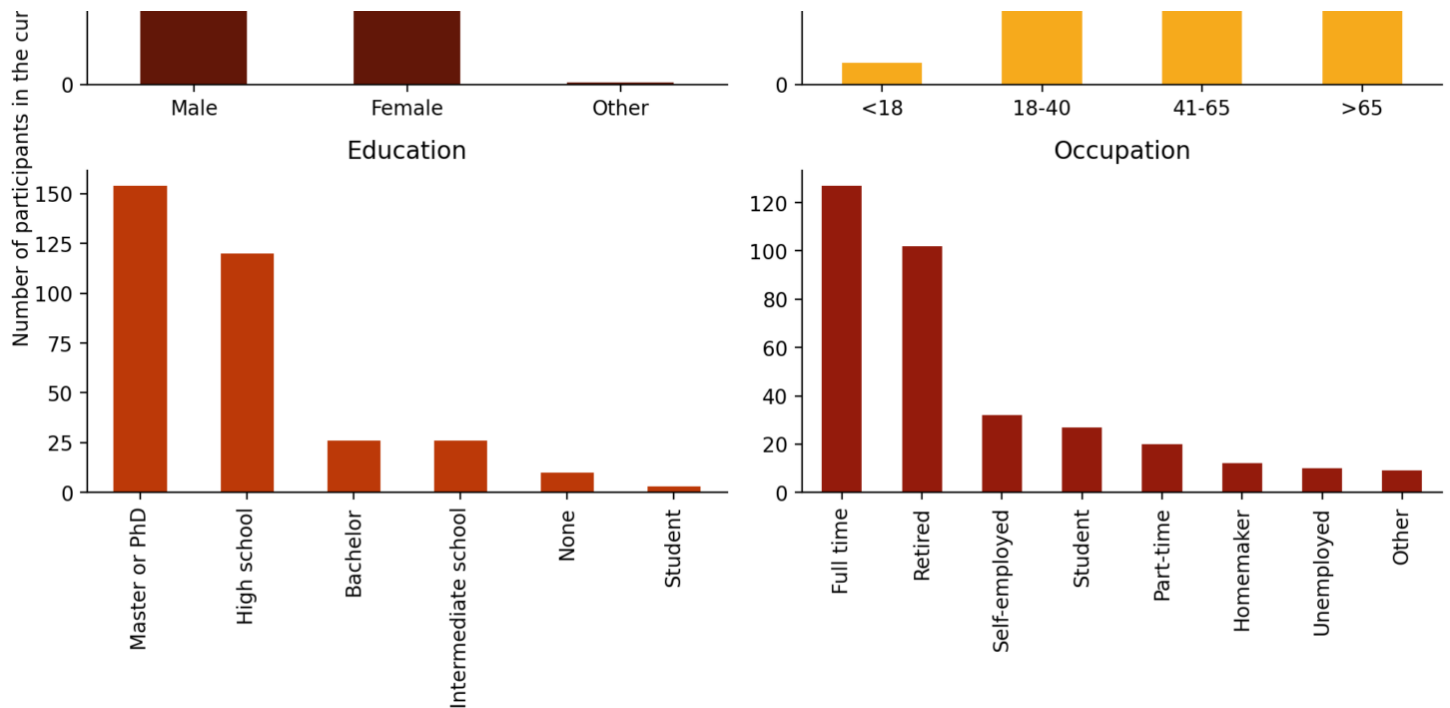

In this section you can find updated data collected by Influeweb regarding influenza symptoms. The graph below shows the incidence curve of probable cases of influenza-like illness (ILI) and cases of acute respiratory syndrome (ARI) observed throughout Italy in the last year. The solid line represents an estimate of the incidence in the current week, the transparent area represents the 95% uncertainty of the estimate.

Demographic composition of participants

In this section we show the demographic characteristics of the participants in the current season. The graphs below show the demographic composition in terms of gender, age, education, and occupation.

Geographic aspects

The first map shows the cumulative incidence in the current season of probable cases of influenza-like illness (ILI) reported in each region by Influenza participants. The second map shows the regional coverage of participants in each region expressed as the number of participants per 100,000 inhabitants.

ILI attack rate Participants
